

Software Engineering

Rogério de Lemos

-
- ◆ System models

- ◆ Motivating the usage of models
- ◆ System models
 - ◆ context, interaction, structural, behavioral models
- ◆ Example of models
- ◆ Model driven engineering

Rely heavily on models

Solar PV Panels on house and carport roofs

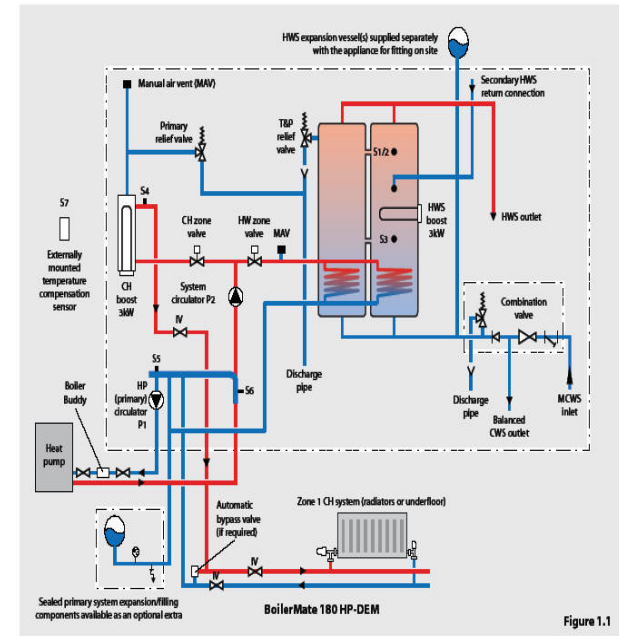

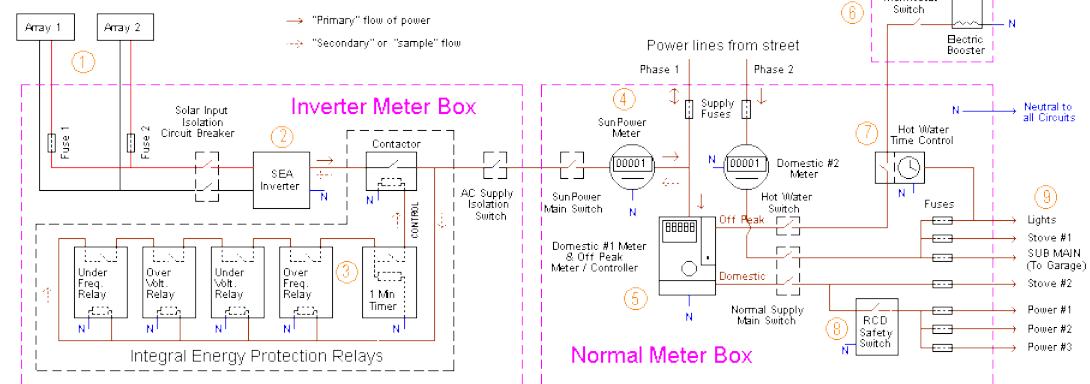

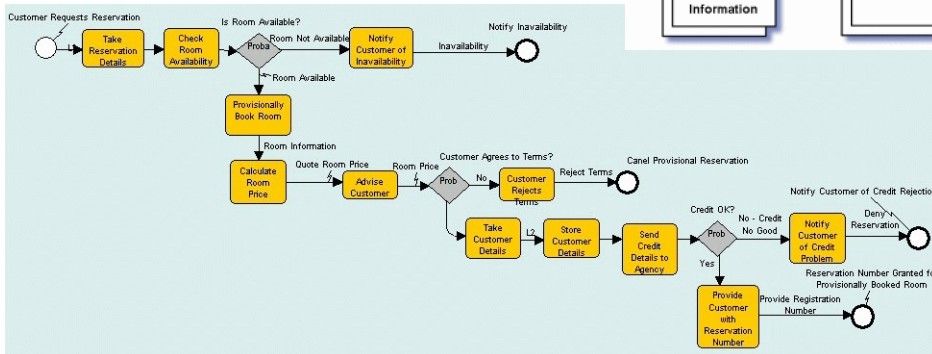

Figure 1.1

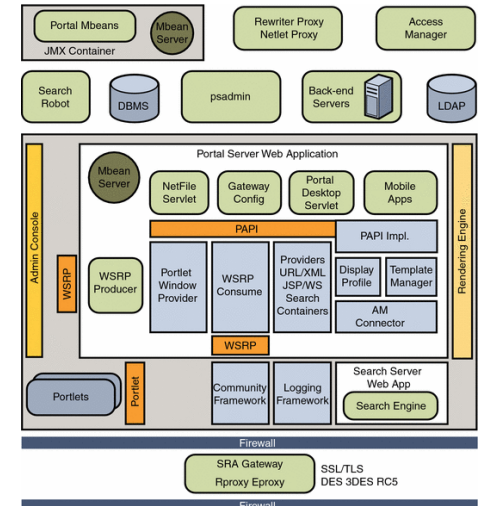

The diagram shows the following classes and their attributes:

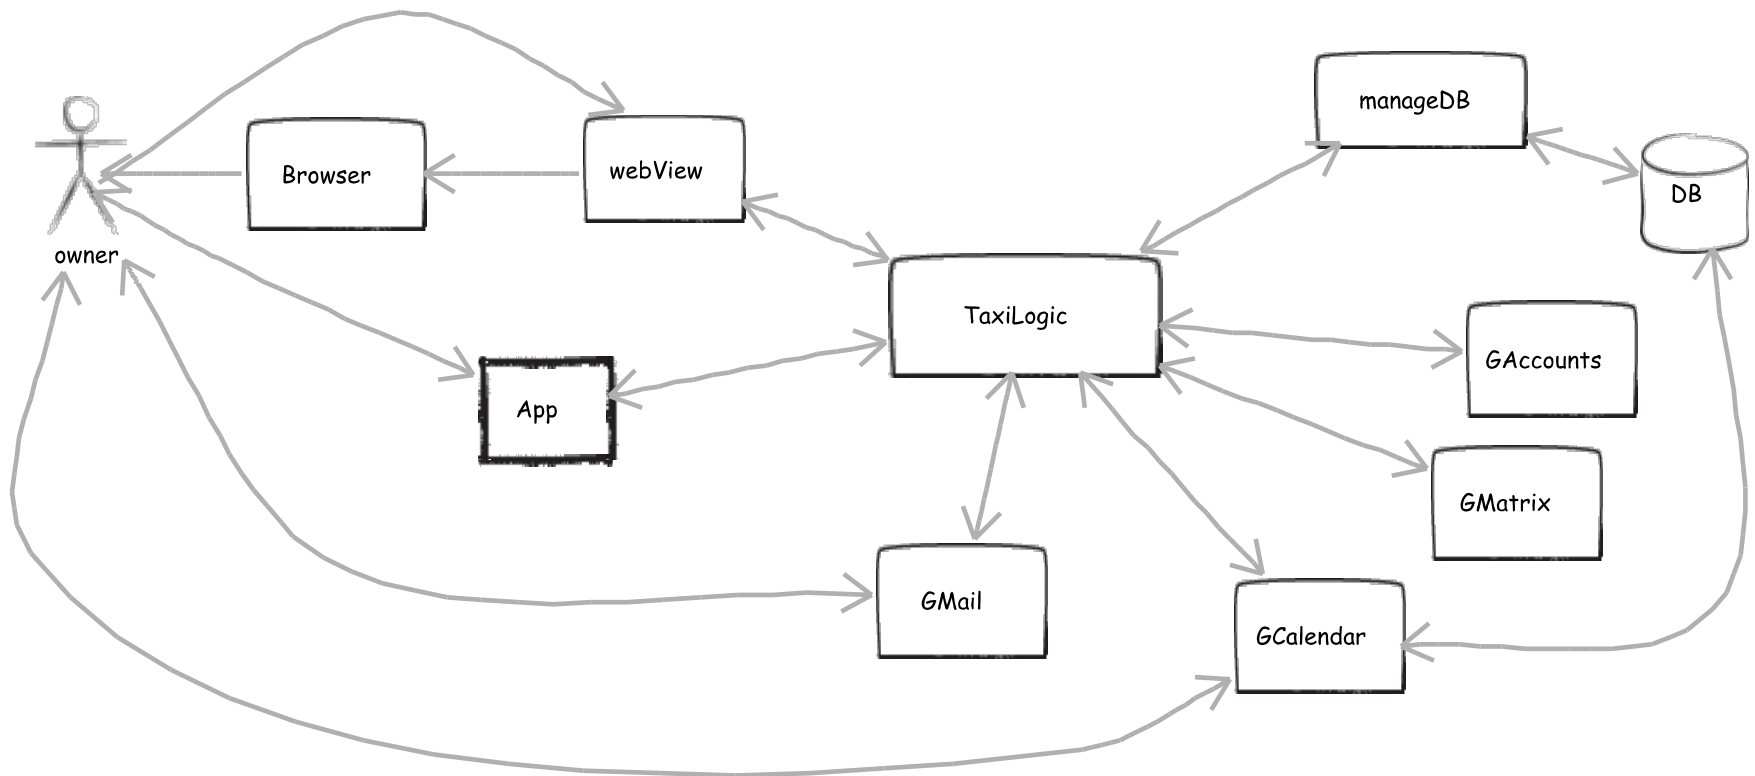

- Class 1 (Top Left):**
 - Attributes: `id`, `name`, `description`, `status`
- Class 2 (Top Right):**
 - Attributes: `id`, `name`, `description`, `status`
- Class 3 (Middle Left):**
 - Attributes: `id`, `name`, `description`, `status`
- Class 4 (Middle Right):**
 - Attributes: `id`, `name`, `description`, `status`
- Class 5 (Bottom Left):**
 - Attributes: `id`, `name`, `description`, `status`
- Class 6 (Bottom Center):**
 - Attributes: `id`, `name`, `description`, `status`
- Class 7 (Bottom Right):**
 - Attributes: `id`, `name`, `description`, `status`

Relationships (Associations) are shown with lines and multiplicities:

- Class 1 to Class 2: Multiplicity 1 at Class 1, 1 at Class 2.
- Class 1 to Class 3: Multiplicity 1 at Class 1, 1 at Class 3.
- Class 1 to Class 4: Multiplicity 1 at Class 1, 1 at Class 4.
- Class 1 to Class 5: Multiplicity 1 at Class 1, 1 at Class 5.
- Class 1 to Class 6: Multiplicity 1 at Class 1, 1 at Class 6.
- Class 1 to Class 7: Multiplicity 1 at Class 1, 1 at Class 7.
- Class 2 to Class 3: Multiplicity 1 at Class 2, 1 at Class 3.
- Class 2 to Class 4: Multiplicity 1 at Class 2, 1 at Class 4.
- Class 2 to Class 5: Multiplicity 1 at Class 2, 1 at Class 5.
- Class 2 to Class 6: Multiplicity 1 at Class 2, 1 at Class 6.
- Class 2 to Class 7: Multiplicity 1 at Class 2, 1 at Class 7.
- Class 3 to Class 4: Multiplicity 1 at Class 3, 1 at Class 4.
- Class 3 to Class 5: Multiplicity 1 at Class 3, 1 at Class 5.
- Class 3 to Class 6: Multiplicity 1 at Class 3, 1 at Class 6.
- Class 3 to Class 7: Multiplicity 1 at Class 3, 1 at Class 7.
- Class 4 to Class 5: Multiplicity 1 at Class 4, 1 at Class 5.
- Class 4 to Class 6: Multiplicity 1 at Class 4, 1 at Class 6.
- Class 4 to Class 7: Multiplicity 1 at Class 4, 1 at Class 7.
- Class 5 to Class 6: Multiplicity 1 at Class 5, 1 at Class 6.
- Class 5 to Class 7: Multiplicity 1 at Class 5, 1 at Class 7.
- Class 6 to Class 7: Multiplicity 1 at Class 6, 1 at Class 7.

Architectural sketch of MVC based application

- ◆ complexity of the problem domain and software
- ◆ masking its complexity

“give illusion of simplicity”

- ◆ facing changes

birth of new technology

change of conditions or process

change of requirements

....

- ◆ fragile

a bit or byte out of place can cause problem

we have to be careful while making changes

- ◆ a large software product is a capital investment
 - cannot afford scrap it,*
 - software maintenance/evolution,*
 - we write less code, automate?*
 - reuse the existing code*
- ◆ communication between team members
 - e.g., “million lines of code”*

System modeling is the process of developing abstract models of a system

- ◆ each model presenting a different view or perspective of that system

System modelling

- ◆ helps the analyst to understand the structure and behaviour of the system
 - ◆ structure of the system in terms of its components
 - ◆ interaction between the components
- ◆ are used to communicate with customers

Models of the **existing system** are used during requirements engineering

- ◆ clarify what the existing system does and can be used as a basis for discussing its strengths and weaknesses
- ◆ lead to requirements for the new system

Models of the **new system** are used during requirements engineering to help explain the proposed requirements to other system stakeholders

- ◆ these models are used to discuss design proposals and to document the system for implementation

In a **model-driven engineering** process, it is possible to generate a complete or partial system implementation from the system model

- ◆ **external perspective**

- ◆ models the context or environment of the system

- ◆ **interaction perspective**

- ◆ models the interactions
 - ◆ between a system and its environment
 - ◆ between the components of a system

- ◆ **structural perspective**

- ◆ models the organization of a system or the structure of the data that is processed by the system

- ◆ **behavioral perspective**

- ◆ models the dynamic behavior of the system and how it responds to events

- ◆ Context models
 - ◆ illustrate the operational context of a system
 - ◆ they show what lies outside the system boundaries
- ◆ Social and organisational concerns may affect the decision on where to position system boundaries.
- ◆ Architectural models show the system and its relationship with other systems

System boundaries

- ◆ define what is inside and what is outside the system
- ◆ show other systems that are used or depend on the system being developed

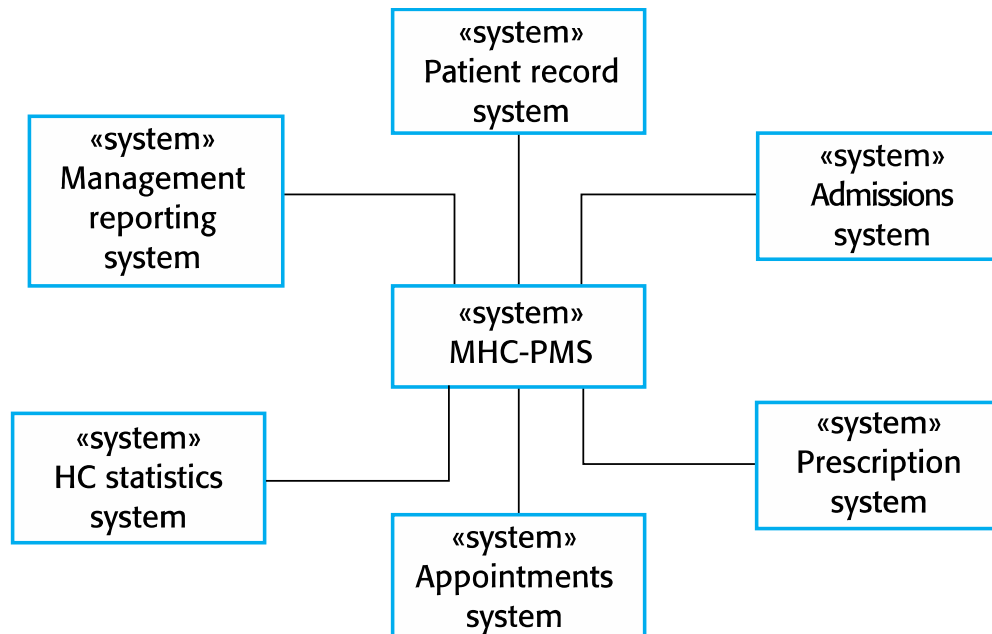

The position of the system boundary has a profound effect on the system requirements

Defining a system boundary is a political judgment

- ◆ there may be pressures to develop system boundaries that increase / decrease the influence or workload of different parts of an organization

Example

- ◆ Mental Health Care Patient Management System (MHC-PMS)

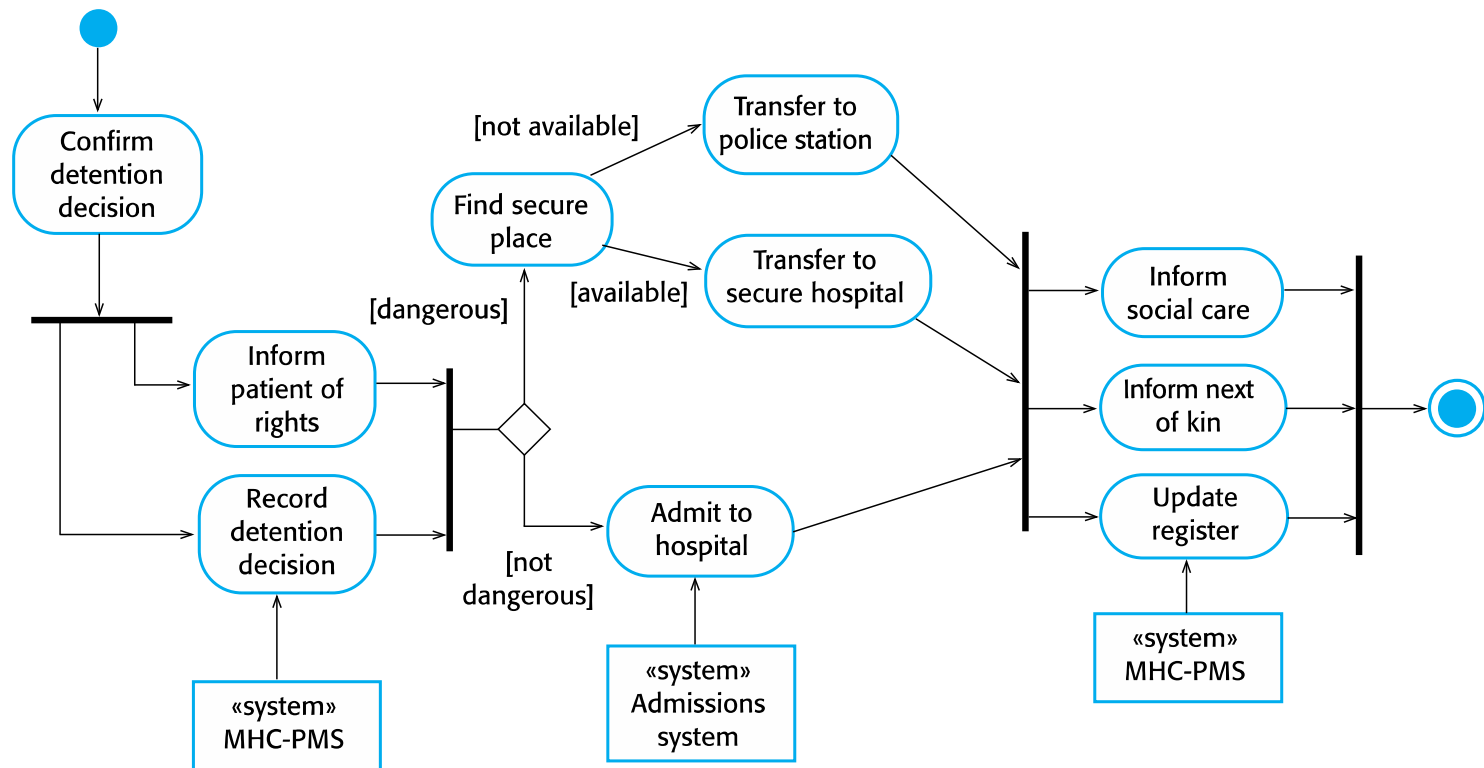

Context models simply show the other systems in the environment, not how the system being developed is used in that environment

- ◆ **process models** reveal how the system being developed is used in broader business processes
 - ◆ **UML activity diagrams** may be used to define business process models
 - ◆ **WS-BPEL: Web Services Business Process Execution Language**

Example

◆ MHC-PMS involuntary detention

- ◆ Modelling **user interaction** is important as it helps to identify user requirements
- ◆ Modelling **system-to-system interaction** highlights the communication problems that may arise
- ◆ Modelling **component interaction** helps us understand if a proposed system structure is likely to deliver the required system performance and dependability
- ◆ **UML use case** and **UML sequence** diagrams may be used for interaction modelling

Structural models display the organization of a system in terms of

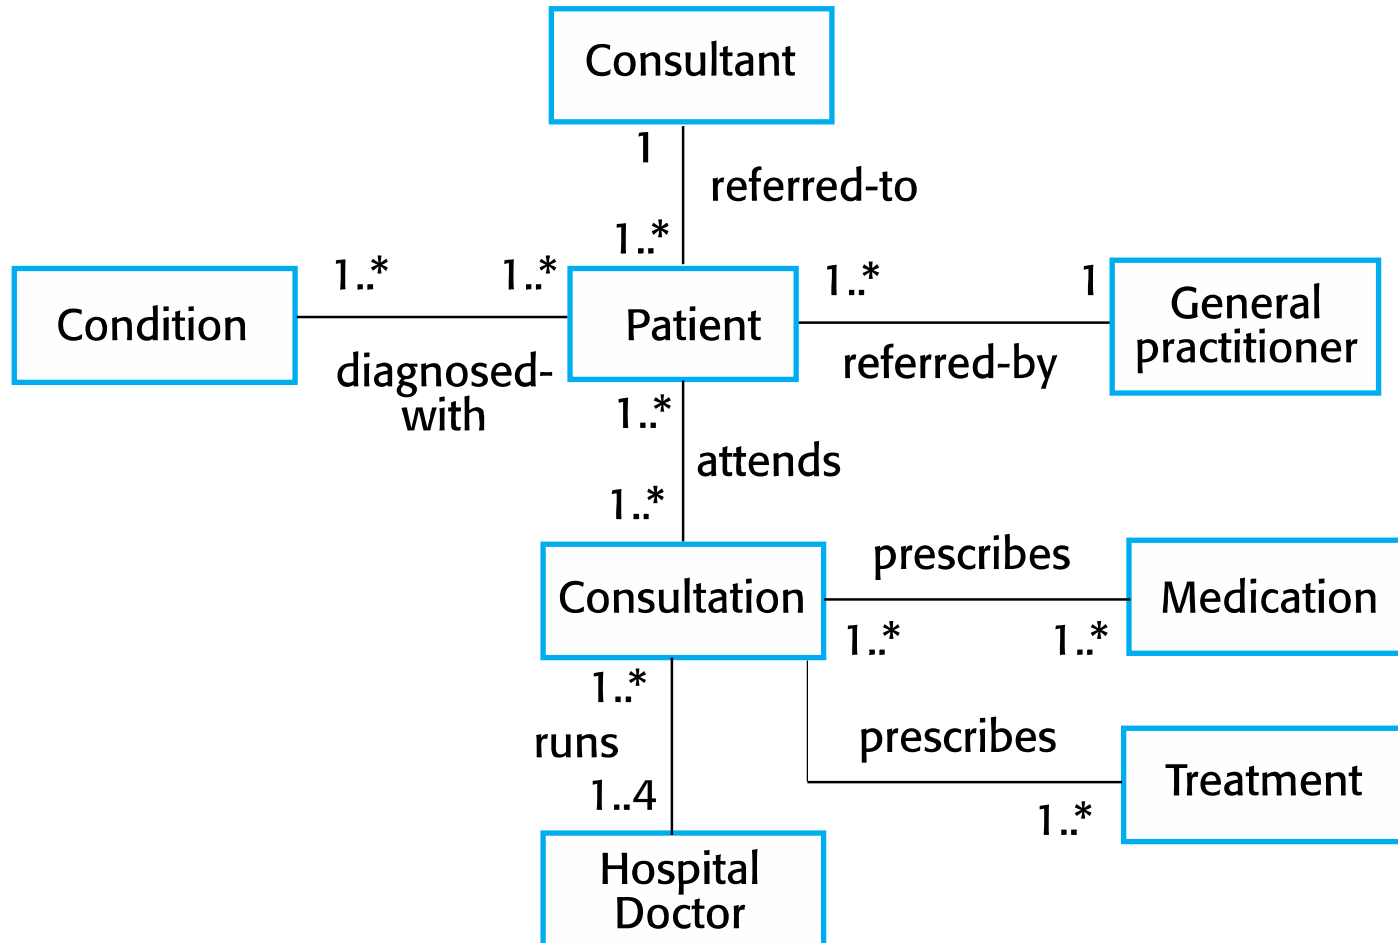

- ◆ components that make up that system
- ◆ their relationships

Structural models may be

- ◆ **static models**, which show the structure of the system design
- ◆ **dynamic models**, which show the organization of the system when it is executing

Structural models of a system are created when discussing and designing the system architecture

UML Class Diagram of MHC-PMS

Behavioral models are models of the dynamic behavior of a system as it is executing

- ◆ show what happens or what is supposed to happen when a system responds to a stimulus from its environment

You can think of these stimuli as being of two types

- ◆ **data** - some data arrives that has to be processed by the system.
- ◆ **events** - some event happens that triggers system processing
 - ◆ events may have associated data, although this is not always the case

Data-processing systems that are primarily driven by data

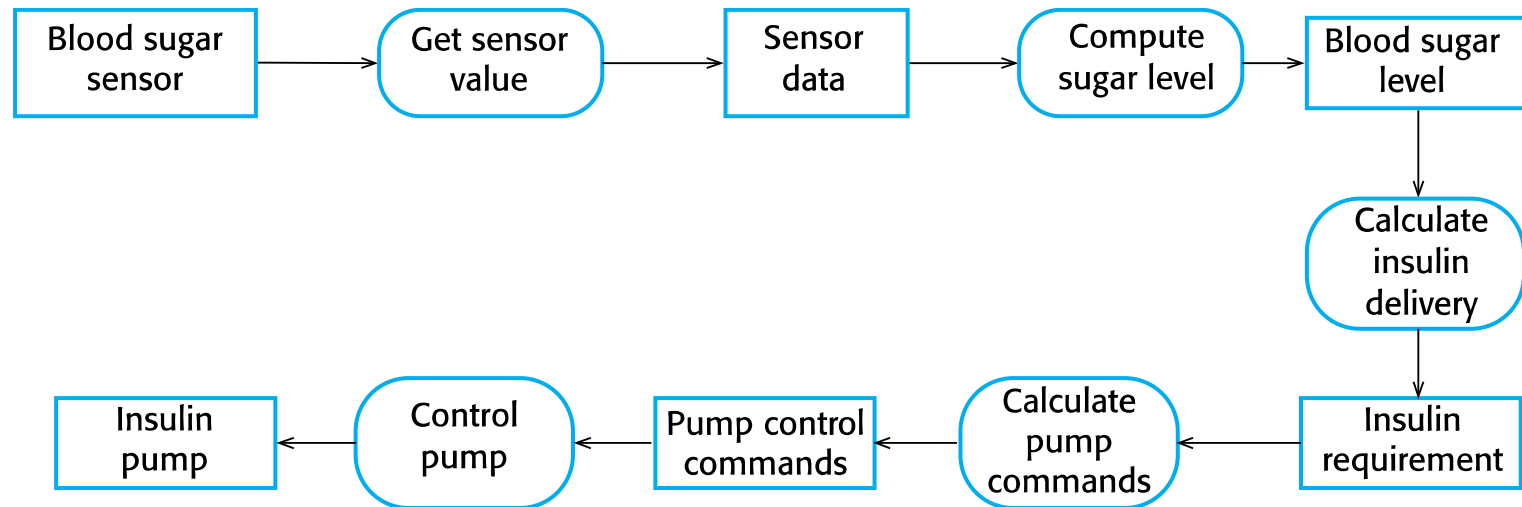

- ◆ controlled by the data input to the system, with relatively little external event processing
- ◆ e.g., business systems

Data-driven models represent

- ◆ sequence of actions involved in processing input data
- ◆ generating an associated output
- ◆ useful during the analysis of requirements as they can be used to show end-to-end processing in a system

Data-driven Modeling: Example

An activity model of the insulin pump's operation

In event-driven systems there is minimal data processing

- ◆ e.g., real-time systems
 - ◆ a landline phone switching system responds to events such as 'receiver off hook' by generating a dial tone

Event-driven modeling shows

- ◆ how a system responds to external and internal events
- ◆ based on the assumption that a system has a finite number of states
 - ◆ events (stimuli) may cause a transition from one state to another

State machines

- ◆ model the behaviour of the system in response to external and internal events
- ◆ show the system's responses to stimuli

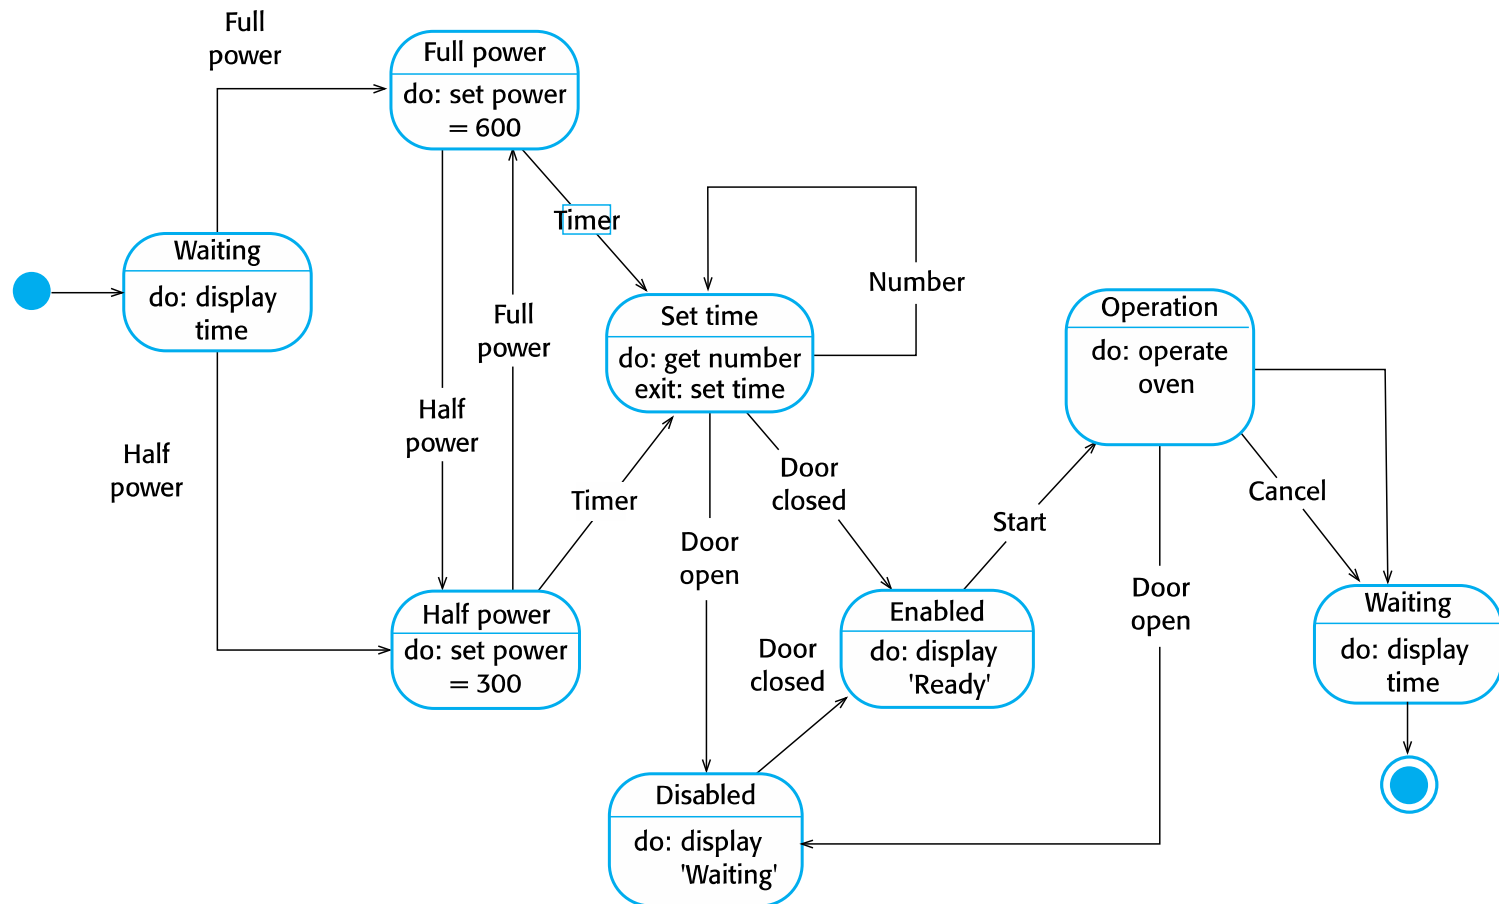

State machine models show

- ◆ system states as nodes and events as arcs between these nodes
- ◆ when an event occurs, the system moves from one state to another.

UML state diagrams are used to represent state machine models

State Machine Models: Example

State diagram of a microwave oven

Models range from formal (mathematical/precise semantics) to informal (textual description)

- ◆ UML are rigorous models (formal semantics) based on diagram and text
 - ◆ diagrams can be subjected to all kinds of consistency checks
 - ◆ even generate executable code from diagrams

Techniques before and after OO design

- ◆ traditional techniques focus on identifying the functions of the system
- ◆ object-oriented techniques focus on identifying and interrelating the objects that play a role in the system

- ◆ Entity-relationship modelling(ERM)
 - ◆ data modelling technique
 - ◆ UML classs diagrams are based on ERM
- ◆ Finite state machines (FSMs)
 - ◆ model states and state transitions
 - ◆ e.g., UML state diagrams
- ◆ Data flow diagrams (DFD)
 - ◆ model a system as a set of processes and data flows that connect these processes
 - ◆ result from a top-down decomposition process
 - ◆ UML sequence diagrams
- ◆ Class—Responsibility-Collaborators (CRC) cards
 - ◆ simple requirements elicitation tool

Model-driven engineering (MDE)

- ◆ an approach to software development where models rather than programs are the principal outputs of the development process
- ◆ programs are then generated automatically from the models
- ◆ this raises the level of abstraction in software engineering
 - ◆ engineers no longer have to be concerned with programming language details
 - ◆ specifics of execution platforms

Model-driven engineering is still at an early stage of development

- ◆ it is unclear whether or not it will have a significant effect on software engineering practice

Pros

- ◆ allows systems to be considered at higher levels of abstraction
- ◆ automatic generation of code means that it is cheaper to adapt systems to new platforms

Cons

- ◆ models for abstraction and not necessarily right for implementation
- ◆ savings from generating code may be outweighed by the costs of developing translators for new platforms

Model-driven architecture (MDA)

- ◆ was the precursor of more general model-driven engineering

MDA is a model-focused approach to software design and implementation

- ◆ uses a subset of UML models to describe a system
- ◆ models at different levels of abstraction are created
 - ◆ from a high-level, platform independent model, it is possible to generate a working program without manual intervention

Computation independent model (CIM)

- ◆ model the domain abstractions used in a system
- ◆ CIMs are sometimes called domain models

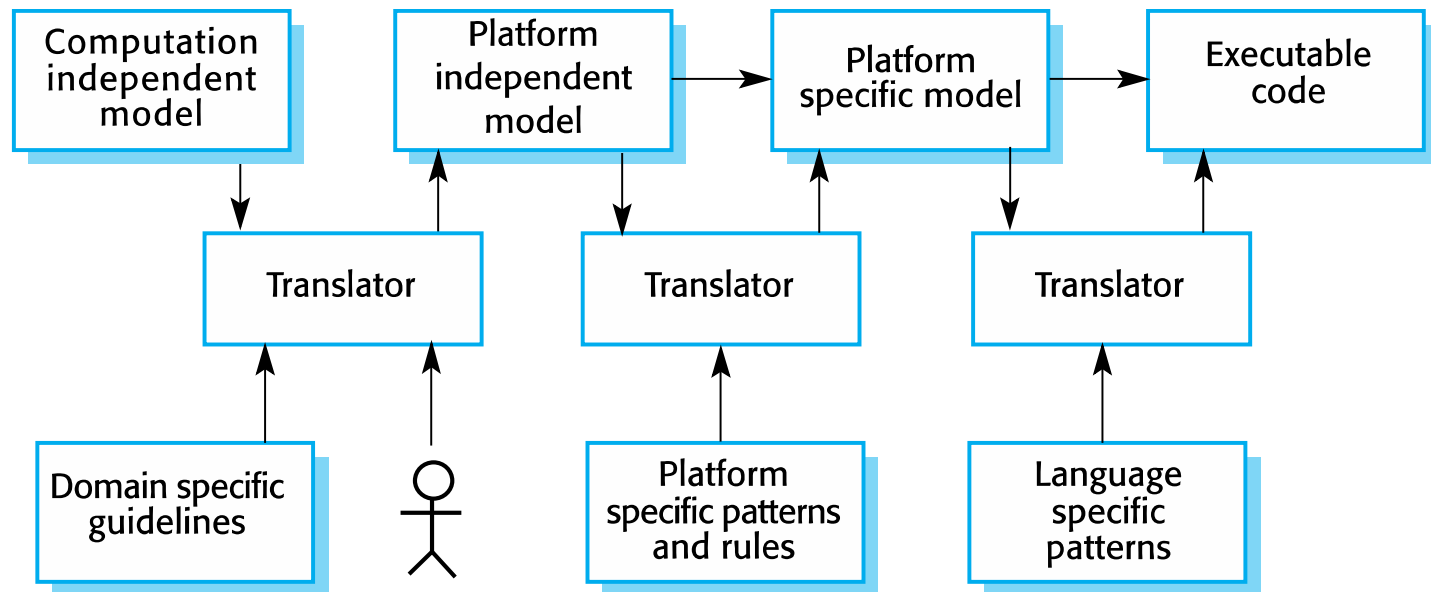

Platform independent model (PIM)

- ◆ model the operation of the system without reference to its implementation
- ◆ PIM is usually described using UML models
 - ◆ show the static system structure and how it responds to external and internal events.

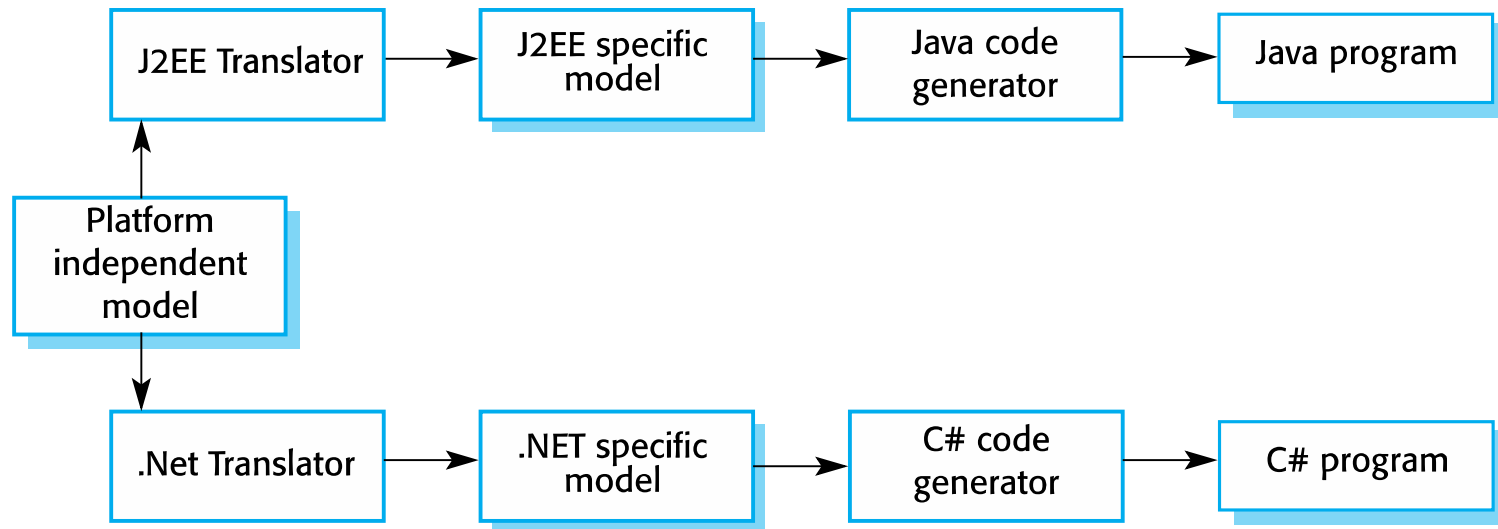

Platform specific models (PSM)

- ◆ transformations of the platform-independent model with a separate PSM for each application platform
- ◆ there may be layers of PSM
 - ◆ each layer adding some platform-specific detail

MDA Transformations

Multiple Platform-specific Models

Models - Key Points

- ◆ A **model** is an abstract view of a system that ignores system details
 - ◆ complementary system models can be developed to show the system's context, interactions, structure and behaviour
- ◆ **Context models** show how a system that is being modeled is positioned in an environment with other systems and processes.
- ◆ **Interactions models** represent interactions between users and systems, and between system components
- ◆ **Structural models** show the organization and architecture of a system

Models - Key Points

- ◆ **Behavioral models** describe the dynamic behavior of an executing system
 - ◆ from the perspective of the data processed by the system
 - ◆ from the perspective of the events that stimulate responses from a system
- ◆ **Model-driven engineering** is an approach to software development in which a system is represented as a set of models that can be automatically transformed to executable code
